

SCIB 265L History of Science
FA18 Week 4: Spanish Empire Mapmaking

NAME: _____
Section: _____

BACKGROUND:

Latitude

Lines of latitude measure north-south position between the poles. The equator is defined as 0 degrees, the North Pole is 90 degrees north, and the South Pole is 90 degrees south. Lines of latitude are all parallel to each other, thus they are often referred to as parallels.

Longitude

Lines of longitude, or meridians, run between the North and South Poles. They measure east-west position. The prime meridian is assigned the value of 0 degrees, and runs through Greenwich, England. Meridians to the west of the prime meridian are measured in degrees west and likewise those to the east of the prime meridian are measured to by their number of degrees east.

Accuracy

Accuracy is how close a measured value is to the **actual (true) value**.

Precision

Precision is how close the measured values are **to each other**.

Examples of Accuracy and Precision:

Solar Declination

Solar declination is defined as “**the angle between the Sun’s rays and the equatorial plane**”...the solar declination on any particular day of the year can be calculated.
